The Claims

- (Currently Amended) Cluster management software comprising: Software residing at one or more computer systems collectively operable to execute the software, the software comprising;
- a plurality of cluster agents, each cluster agent associated with an HPC node including an integrated fabric and the cluster agent one of a plurality of nodes, each node comprising a switching fabric integrated to a card and at least two processors integrated to the card, the cluster agent operable to determine a status of the associated HPC node; and
- a cluster management engine communicably coupled with the plurality of the HPC nodes and operable to execute an HPC job using a dynamically allocated subset of the plurality of HPC nodes based on the determined status of the plurality of HPC nodes to the plurality of nodes and operable to dynamically allocate a particular subset of the plurality of nodes to a particular job based on the determined status of each of one or more of the plurality of nodes and execute the job using the particular subset.
- (Currently Amended) The cluster management software of Claim 1, <u>wherein</u> the cluster management engine <u>is</u> further operable to determine a topology of the plurality of nodes based, at least in part, on the determined status of the HPC nodes.
- (Currently Amended) The eluster-management software of Claim 2, wherein the topology eomprising comprises a three dimensional Torus.
- 4. (Currently Amended) The cluster management software of Claim 1, <u>wherein</u> the cluster management engine <u>is</u> further operable to dynamically allocate a virtual cluster in the plurality of HPC nodes, the dynamically allocated particular subset for executing dynamically allocated to the HPC observed the transfer of the tr

 (Currently Amended) The cluster management software of Claim 4, <u>wherein</u> the cluster management engine is further operable to:

dynamically allocate a second <u>particular</u> subset of HPC nodes in the virtual cluster; and execute a second HPC job using the second <u>particular</u> subset.

- (Currently Amended) The eluster-management software of Claim 4, wherein the virtual cluster is associated with a user group.
- (Currently Amended) The eluster-management software of Claim 6, wherein the
 cluster management engine is further operable to verify a user submitting the HPC job based, at
 least in part, on the user group.
- (Currently Amended) The cluster management software of Claim 4, <u>wherein</u> the cluster management engine <u>is</u> further operable to dynamically allocate a second virtual cluster in the plurality of HPC nodes.
- (Currently Amended) The cluster management software of Claim 8, <u>wherein</u> the second virtual cluster comprising comprises different HPC nodes from the first virtual cluster.
- 10. (Currently Amended) The cluster management software of Claim 1, wherein the cluster management engine operable wherein, to execute the HPC job using the dynamically allocated particular subset comprises the cluster management engine operable, the cluster management engine is operable to:

receive a job request comprising at least one job parameter one or more job parameters; determine dimensions of the HPC job based, at least in part, on the one or more job

dynamically allocate the <u>particular</u> subset of the plurality of HPC nodes based, at least in part, on the determined dimensions: and

execute the HPC job using the dynamically allocated particular subset.

parameters;

 (Currently Amended) The eluster management software of Claim 10, wherein the cluster management engine is further operable to:

select a policy based on the job request; and

dynamically determine the dimensions of the HPC job further based on the selected policy.

(Currently Amended) A method for managing clusters comprising:

determining a status of <u>each of at least</u> a subset of a plurality of HPC nodes, each node comprising an integrated fabric; and a <u>switching fabric integrated to a card and at least two</u> processors integrated to the card;

dynamically allocating a particular subset of the plurality of nodes to a particular job based on the determined status of each of one or more of the plurality of nodes; and

executing an HPC the job using a dynamically allocated the particular subset of the plurality of HPC nodes, the subset allocated based on the determined status.

- (Currently Amended) The method of Claim 12, further comprising determining a topology of the plurality of nodes based, at least in part, on the determined status from of the HPC nodes
- (Currently Amended) The method of Claim 13, wherein the topology emprising comprises a three dimensional Torus.
- 15. (Currently Amended) The method of Claim 12, further comprising dynamically allocating a virtual cluster in the plurality of HPC nodes, the dynamically allocated particular subset for executing the HPC dynamically allocated to the job comprising at least a subset of the virtual cluster.

- (Currently Amended) The method of Claim 15, further comprising: dynamically allocating a second <u>particular</u> subset of HPC nodes in the virtual cluster; and executing a second HPC iob using the second particular subset.
- (Currently Amended) The method of Claim 15, wherein the virtual cluster is associated with a user group.
- (Currently Amended) The method of Claim 17, further comprising verifying a user submitting the HPC job based, at least in part, on the user group.
- (Currently Amended) The method of Claim 15, further comprising dynamically allocating a second virtual cluster in the plurality of HPC nodes.
- (Currently Amended) The method of Claim 19, wherein the second virtual cluster emprising comprises different HPC nodes from the first virtual cluster.
- 21. (Currently Amended) The method of Claim 12, wherein executing the HPC job using the dynamically allocated particular subset comprises:

receiving a job request comprising at least one job parameter one or more job parameters; determining dimensions of the HPC job based, at least in part, on the one or more job parameters;

dynamically allocating the <u>particular</u> subset of the <u>plurality of HPC nodes</u> based, at least in part, on the determined dimensions; and

executing the HPC job using the dynamically allocated particular subset.

22. (Currently Amended) The method of Claim 21, further comprising: selecting a policy based on the job request; and

dynamically determining the dimensions of the HPC job further based on the selected policy.

(Currently Amended) A cluster management system comprising:

a plurality of HPC computing nodes, each computing node including an integrated fabric and operable to communicate a status; and comprising a switching fabric integrated to a card and at least two processors integrated to the eard, the computing node further comprising an agent operable to determine a status of the computing node and communicate the status to a management node;

a management node the management node, communicably coupled with the plurality of the HPC nodes and operable to execute an HPC job using a dynamically allocated subset of the plurality of HPC nodes to the plurality of computing nodes and operable to dynamically allocate a particular subset of the plurality of computing nodes to a particular job based on the determined status of each of one or more of the plurality of computing nodes and execute the job using the particular subset.

- 24. (Currently Amended) The system of Claim 23, wherein the management node is further operable to determine a topology of the plurality of nodes based, at least in part, on receiving the determined status from the HPG computing nodes.
- (Currently Amended) The system of Claim 24, wherein the topology comprising comprises a three dimensional Torus.
- 26. (Currently Amended) The system of Claim 23, wherein the management node is further operable to dynamically allocate a virtual cluster in the plurality of HPC computing nodes, the dynamically allocated particular subset for executing dynamically allocated to the HPC job comprising at least a subset of the virtual cluster.

 (Currently Amended) The system of Claim 26, wherein the management node is further operable to:

dynamically allocate a second subset of HPC computing nodes in the virtual cluster; and execute a second HPC job using the second subset.

- (Currently Amended) The system of Claim 26, wherein the virtual cluster is associated with a user group.
- (Currently Amended) The system of Claim 28, wherein the management node is further operable to verify a user submitting the HPC job based, at least in part, on the user group.
- (Currently Amended) The system of Claim 26, wherein the management node is further operable to dynamically allocate a second virtual cluster in the plurality of HPC computing nodes.
- (Currently Amended) The system of Claim 30, wherein the second virtual cluster emprising comprises different HPC computing nodes from the first virtual cluster.
- (Currently Amended) The system of Claim 23, wherein the management node
 operable wherein, to execute the HPC job using the dynamically allocated particular subset
 comprises the management node operable to, the management node is operable to;

receive a job request comprising at least one job parameter one or more job parameters;

determine dimensions of the HPC job based, at least in part, on the one or more job parameters:

dynamically allocate the <u>particular</u> subset of the plurality of HPC nodes based, at least in part, on the determined dimensions; and

execute the HPC job using the dynamically allocated particular subset.

33. (Currently Amended) The system of Claim 32, wherein the management node is further operable to:

select a policy based on the job request; and

dynamically determine the dimensions of the $H\!P\!C$ job further based on the selected policy.

- 34. (New) The software of Claim 1, wherein the card is a motherboard.
- 35. (New) The method of Claim 12, wherein the card is a motherboard.
- 36. (New) The system of Claim 23, wherein the card is a motherboard.

37. (New) Software residing at one or more computer systems collectively operable to execute the software, the software comprising:

a plurality of cluster agents, each cluster agent associated with one of a plurality of nodes, the cluster agent operable to determine a status of the associated node, each node comprising:

at least two first processors integrated to a first card and operable to communicate with each other via a direct link between them; and

a first switch integrated to the first card, the first processors communicably coupled to the first switch, the first switch operable to communicably couple the first processors to six or more second cards each comprising at least two second processors integrated to the second card and a second switch integrated to the second card operable to communicably couple the second processors to the first card and at least five third cards each comprising at least two third processors integrated to the third card and a third switch integrated to the third card;

the first processors being operable to communicate with particular second processors on a particular second card via the first switch and the second switch on the particular second card;

the first processors being operable to communicate with particular third processors on a particular third card via the first switch, a particular second switch on a particular second card between the first card and the particular third card, and the third switch on the particular third card without communicating via either second processor on the particular second card; and

a cluster management engine communicably coupled to the plurality of nodes and operable to dynamically allocate a particular subset of the plurality of nodes to a particular job based on the determined status of each of one or more of the plurality of nodes and execute the job using the particular subset.

10/825539

38. (New) A method comprising:

064747.1014

determining a status of each of at least a subset of a plurality of nodes, each node comprising:

at least two first processors integrated to a first card and operable to communicate with each other via a direct link between them: and

a first switch integrated to the first card, the first processors communicably coupled to the first switch, the first switch operable to communicably couple the first processors to six or more second cards each comprising at least two second processors integrated to the second card and a second switch integrated to the second card operable to communicably couple the second processors to the first card and at least five third cards each comprising at least two third processors integrated to the third card and a third switch integrated to the third card;

the first processors being operable to communicate with particular second processors on a particular second card via the first switch and the second switch on the particular second card;

the first processors being operable to communicate with particular third processors on a particular third card via the first switch, a particular second switch on a particular second card between the first card and the particular third card, and the third switch on the particular third card without communicating via either second processor on the particular second card;

dynamically allocating a particular subset of the plurality of nodes to a particular job based on the determined status of each of one or more of the plurality of nodes; and

executing the job using the particular subset.

(New) A system comprising:

a plurality of computing nodes, each computing node comprising:

an agent operable to determine a status of the computing node and communicate the status to a management node;

at least two first processors integrated to a first card and operable to communicate with each other via a direct link between them; and

a first switch integrated to the first card, the first processors communicably coupled to the first switch, the first switch operable to communicably couple the first processors to six or more second cards each comprising at least two second processors integrated to the second card and a second switch integrated to the second card operable to communicably couple the second processors to the first card and at least five third cards each comprising at least two third processors integrated to the third card and a third switch integrated to the third card;

the first processors being operable to communicate with particular second processors on a particular second card via the first switch and the second switch on the particular second card;

the first processors being operable to communicate with particular third processors on a particular third card via the first switch, a particular second switch on a particular second card between the first card and the particular third card, and the third switch on the particular third card without communicating via either second processor on the particular second card; and

the management node, communicably coupled to the plurality of computing nodes and operable to dynamically allocate a particular subset of the plurality of computing nodes to a particular job based on the determined status of each of one or more of the plurality of computing nodes and execute the job using the particular subset.
